                                                                                                                                                                                                                                                            Gaps
                              Five synthetic sequences (AAT29063-67) are used as probes to detect the presence of Candida albicans and Candida stellatoides in biological fluids e.g. sputum, bronchial washings, blood, milk and lymph fluid or in tissue samples e.g. skin and soft tissues. The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29066) as amplification primers and then detecting one of the probe sequences with the amplified product and detecting hybridisation.
                                                                                                                                                                                                                            80

The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29066) as amplification primers and then detecting one of the probe sequences with the amplified product and detecting hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Five synthetic sequences (AAT29063-67) are used as probes to detect the presence of Candida albicans and Candida stellatoides in biological fluids e.g. sputum, bronchial washings, blood, milk and lymph fluid.or in tissue samples e.g. skin and soft tissues. The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29066) as amplification primers and then contacting one of the probe sequences with the amplified product and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequences (AAT29065, AAT29066) as amplification primers and then contacting one of the probe sequences with the amplified product and

The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29066) as amplification primers and then detecting one of the probe sequences with the amplified product and detecting hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 CCAAACCCAACTGTCACCACCACTGAATATTGGTCCCAATCTTACGCAACCACAACTACT 60

                                                                                                                                                                                                                                     Five synthetic sequences (AAT29063-67) are used as probes to detect the presence of Candida albicans and Candida stellatoides in biological fluids e.g. sputum, bronchial washings, blood, milk and. lymph fluid or in tissue samples e.g. skin and soft tissues. The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29066) as amplification primers and then detecting one of the probe sequences with the amplified product and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          contacting one of the probe sequences with the amplified product and detecting hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Five synthetic sequences (AAT29063-67) are used as probes to detect the presence of Candida albicans and Candida stellatoides in biological fluids e.g. sputum, bronchial washings, blood milk and lymph fluid or in tissue samples e.g. skin and soft tissues. The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29066) as amplification primers and then
                                                                                                                                                                                                                                                                                                                                                                                                                               C. albicans and C. stellatoides specific probes and primers - for
specific detection of Candida infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29065 as amplification primers and then contacting one of the probe sequences with the amplified product and

Detecting small integrin-binding ligand N-linked glycoproteins for detection of a tumor or protection against a complement mediated immune response, comprises detection where Factor H is not an inhibitor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of DNA encoding human dentin sialophosphoprotein (DSPP, see AAB1972), a member of the small integrin binding ligand, N-linked glycoproteins (SIBLINGS) family. The invention provides methods and compositions for exploiting the discovery that members of the SIBLINGS family bind to complement Factor H, conferring presistance to complement mediated lysis. A claimed method of conferring protection against a complement mediated immune response involves providing a reservoir or other suppert's body so that a SIBLINGS protein can be dispersed to interfere with complement mediated lysis and inflammation. This protects cells that are grafted onto foreign tissue or bone marrow cells introduced into a foreign host. The SIBLINGS protein can be BSP, OPN, DMPI or DSPP. A method of detecting a SIBLINGS protein in a sample from a subject suspected of having abnormal bone turnover, especially osteoporosis, is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1012 ACCACTGCTGTCACTTTACCATTCAATCCAAGTGTTGATAAAACCAAAACAATGGAA 1071

The method of detection may also comprise using two of the probe sequences (AAT29065, AAT29066) as amplification primers and then centacting one of the probe sequences with the amplified product and detecting hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

Diagnosis of dentinogenesis imperfecta type III and its accompanying deafness using dentin sialophosphoprotein gene and encoded products

Example 3; Page 23-27; 38pp; Chinese

The present invention describes a method (M1) for the diagnosis of dentinogenesis imperfecta type II and/or its accompanying deafness comprising determining the dentin sialophosphoprotein (DSPP) gene, its transcript and/or protein of an individual for comparison of their sequences with the normal sequences and judging the individual to have higher risk of suffering from the disease then the normal population. Also described are: (1) treating dentinogenesis imperfecta type III and/or its accompanying deafness by administering a safe and effective dose of normal DSPP and/or DSP protein; and (3) a regent kit for detecting dentinogenesis imperfecta type III and/or its accompanying containing primers for specific amplification of DSPP gene or its transcript, or containing probes for binding to the mutation site. The DSPP gene and protein sequences have auditory activity. The method [71], dentin sialophosphoprotein (DSPP) gene and DSP protein are useful for for diagnosing and treating imperfects type II and/or its accompanying deafness. The DSPP gene is located to chromosome 4411. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the GP900 glycoprotein of the protozoan Cryptosporitdium parvum, DNA encoding it, GP900 fragments, and fusion proteins comprising GP900 fragments. The invention also relates to the administration of GP900 or fragments thereof to a host to elicit anti-or prophlaxis comprising administration of anti-off and or prophlaxis comprising administration of anti-GP900 antibodies to an individual. Cryptosporidium parvum GP900 and GP900 fragments are able to competitively inhibit sporozoite or merozoite attachment or invasion, and are also useful for the generation of anti-GP900 antibodies. The antibodies also inhibit sporozoite or merozoite attachment/invasion and additionally inhibit the binding of GP900 ligands to GP900. GP900
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   detection of the parasite in the environment. The present sequence represents the open erading frame (ORF) encoding the GP900 protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proteins, fragments and antibodies may therefore be used to treat or prevent cryptosporidiosis. Infection with Cryptosporidium is a common cause of diarrhoea in humans and causes life-threatening diarrhoea in humans compromised persons. Cryptosporidiosis can be contracted from contaminated municipal water supplies (e.g., public symmuning pools). It is also a cause of disease in animals, resulting in financial losses in agriculture. GP900 fragments, fusion proteins and antibodies may also be used for the diagnosis of Cryptosporidium parvum infections, and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /product= "Cryptosporidium parvum Iowa isolate GP900"

The present invention relates to a method of detecting Cryptosporidium in biological and environmental samples, and of diagnosing cryptosporidiosis. This involves obtaining a sample and contacting it with Cryptosporidium GP900, P68 or cryptopain antigen, antibody, DNA or RNA, or its variant, mutant or fragment. The method is also useful for detecting and identifying individual Cryptosporidium isolates based on the genetic characteristics, and for diagnosis of prior or concurrent Cryptosporidium infection. The present sequence is a C. parvum coding sequence used in the exemplification of the invention.
